Abstract

The capabilities of our personal computers have increased dramatically over the past 15 years, and so has the number of **connectors** on the back of our systems. Originally, we needed a **serial port** for a modem and a **parallel port** for a printer. Now we also need ports for a mouse, audio input, audio output, video input, video output, Ethernet, and a camera. Enter the IEEE 1394 standard known as Firewire. This standard proposes to provide a single port on the back of our computers that can handle nearly all of the communication for which we now need eight to 10 ports. Along with **connecting** standard peripherals to computers, Firewire is designed for use with consumer audio, video, and television equipment
